

Finance Refund Control Policy

This newly created document contains portfolio-safe synthetic operating policy. It contains no client data or confidential implementation material.

Policy owner	Finance Controls
Revision	FIN-REFUND-7.1
Effective	29 August 2026
Approval threshold	Manager approval at or above USD 200

Damaged-shipment claim procedure

1	A damaged-shipment refund must reference the original order and may not exceed the captured payment amount.
2	Refund requests below USD 200 may be released automatically only after shipment and evidence validation succeed.
3	Refund requests at or above USD 200 require finance manager approval before any payment operation is attempted.
4	Duplicate requests with the same claim identifier must return the original operation result and must not issue another refund.
5	Connector timeout or malformed output requires human review. The workflow may retry a refund operation once using the same idempotency key.
6	All refund decisions and connector responses must be retained in the append-only audit history.

Control requirements

Every decision must retain the claim identifier, shipment identifier, cited source evidence, rule version, actor, decision timestamp, confidence, and any approval outcome. Failed connector calls must not be treated as successful refunds.

Escalate when evidence is incomplete, policy sources conflict, package identity cannot be established, fraud indicators are present, or the requested amount exceeds the stated approval threshold.
